ACKNOWLEDGMENTS

Special thanks to the Watershed Foresters and many district Forest Officers who read and maintain these gauges. Without them this publication would not be possible.

Also, much appreciation to Resource Evaluation and Planning - Climate Unit (Serge Dupuis and Terry Thompson) for entering all the Sacramento data on their SAS computer files and providing the following listings of the data.

1. INTRODUCTION

The Sacramento precipitation storage gauge network now stands at 130 gauges with five installations in northern Alberta and seven closures in the south. To avoid duplication, all closures occurred in the Bow/Crow Forest, because Alberta Environment had Fisher-Porter gauges located at the same place collecting real time data. Gauges closed were C16, H01, L01, L04, M03, M05 and M06; detailed locations appear in Table 1. New installations include S12 in Slave Lake Forest, V04 in Lac La Biche Forest and W05, W06 and W07 in Footner Lake Forest. These installations were made in consultation with Alberta Forest Service Weather Section which will use this additional data for better forest fire index calculations.

Over the past year all Sacramento gauge locations were checked for accuracy. Several legal descriptions and latitudes/longitudes were previously in error, but are now listed correctly in the Inventory Catalogue (Table 1). With assistance from Energy and Natural Resources Resource Evaluation and Planning, Climate Unit, all 1985 Sacramento precipitation data is listed in Table 2 for the 1983/84 winter precipitation, Table 3, the summer rainfall and Table 4, the annual totals.

The Energy and Natural Resources Climate Unit and Alberta Environment Technical Services Division can also be contacted for more precipitation and other climatic data.

2. SUMMARY

Winter precipitation was much below average in Bow/Crow Forest, increasing gradually northward in Rocky/Clearwater and Edson Forests where it was below normal, average in Grande Prairie Forest and above normal in all northern forests (Table 2). Conditions would have been very dry in all regions, but significant precipitation in April improved conditions slightly.

Drought prevailed throughout most of the province in June, July and August, the time of year that rainfall was required most. Fortunately, the number of forest fires was below average with only a few major burns occurring in northwestern Alberta. By September, the trend reversed when some relatively high rainfalls occurred throughout the province. As a result, Bow/Crow and Rocky/Clearwater had above average rainfall, Edson and Whitecourt Forest average while all northern forests were below average (Table 3).

By water year end (October 1), total precipitation in northwestern Alberta forests was below average, normal in Bow/Crow, Rocky/Clearwater and Lac La Biche Forests and above average in Athabasca, Slave Lake and Whitecourt Forests. With high precipitation continuing into October, water supply should be adequate for the beginning of 1986 and forest fire hazard low.
